Jungpil Seo

Experimental requirements

- 1) Atomically flat superconducting substrate
- 2) Magnetic atoms
- 3) Spin-orbit coupling (or spin texture)

Superconducting Pb (110) substrate

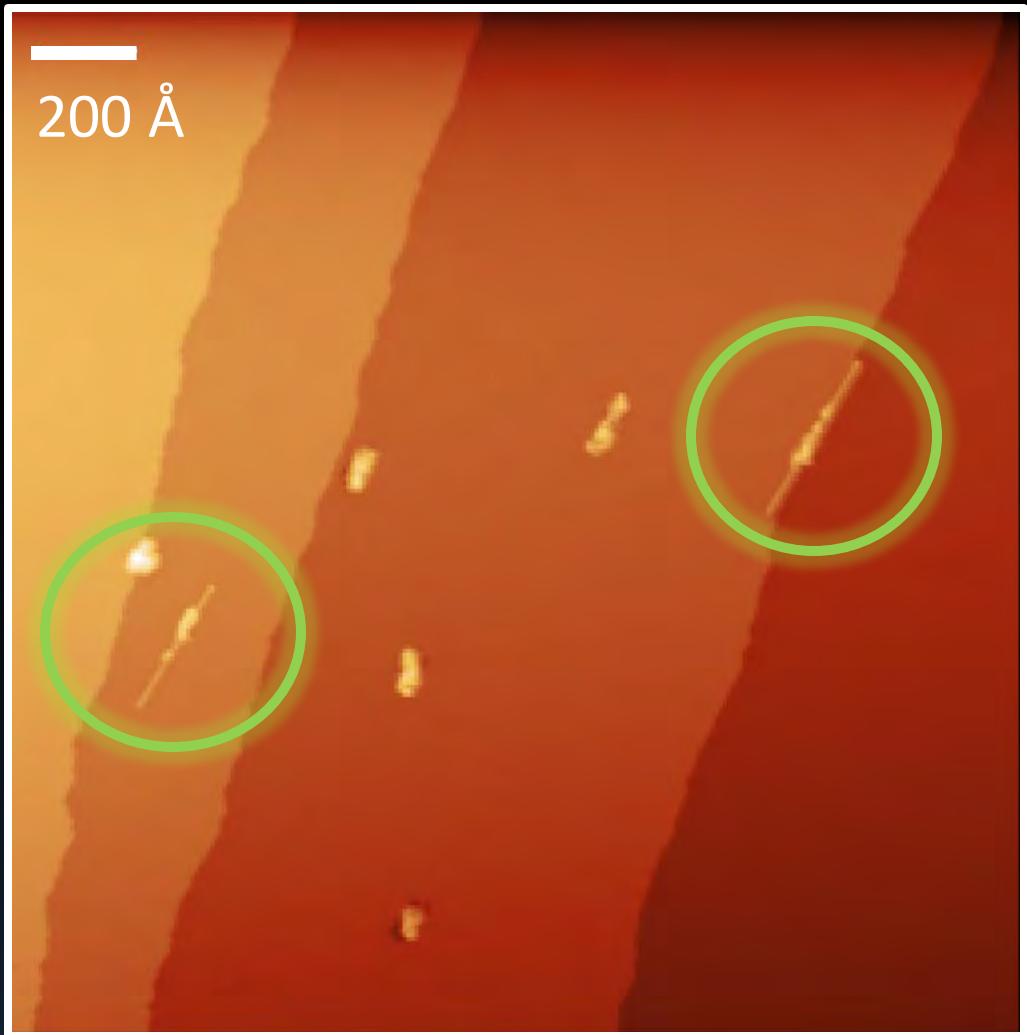

$T_c=7.2\text{K}$, $\xi=830\text{\AA}$, $H_c=80\text{mT}$, $\lambda_L=370\text{\AA}$

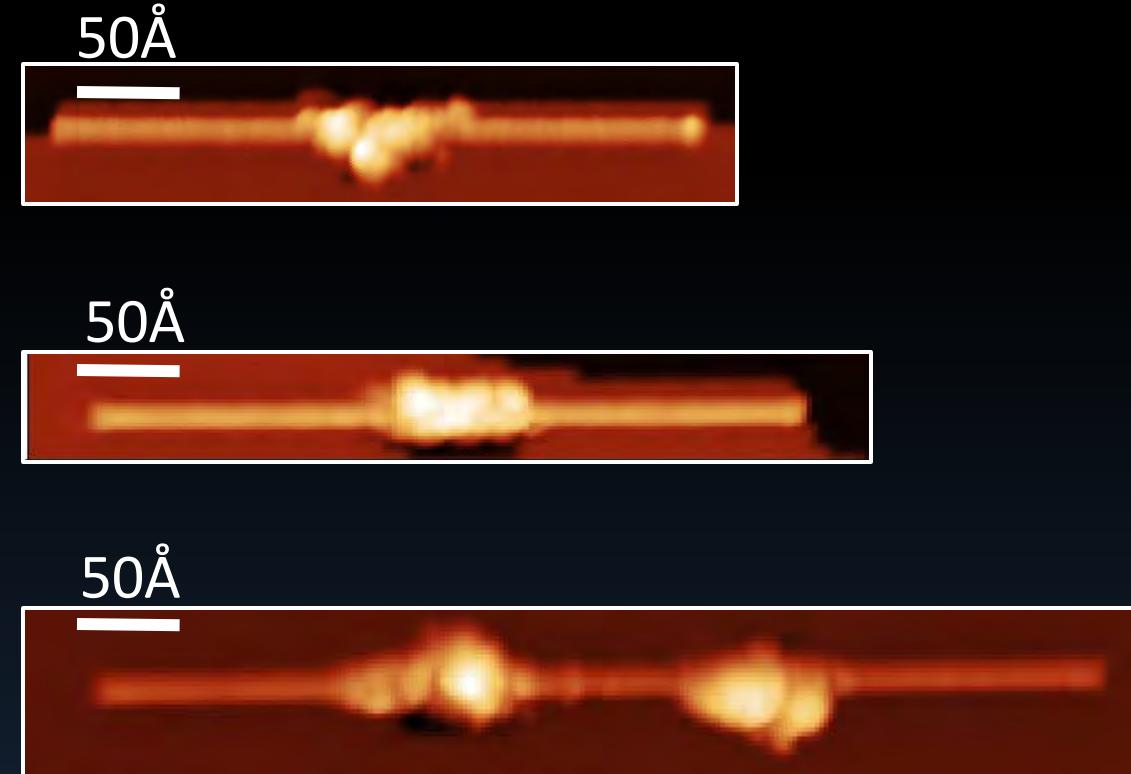

Fe atomic chain growth on Pb substrate

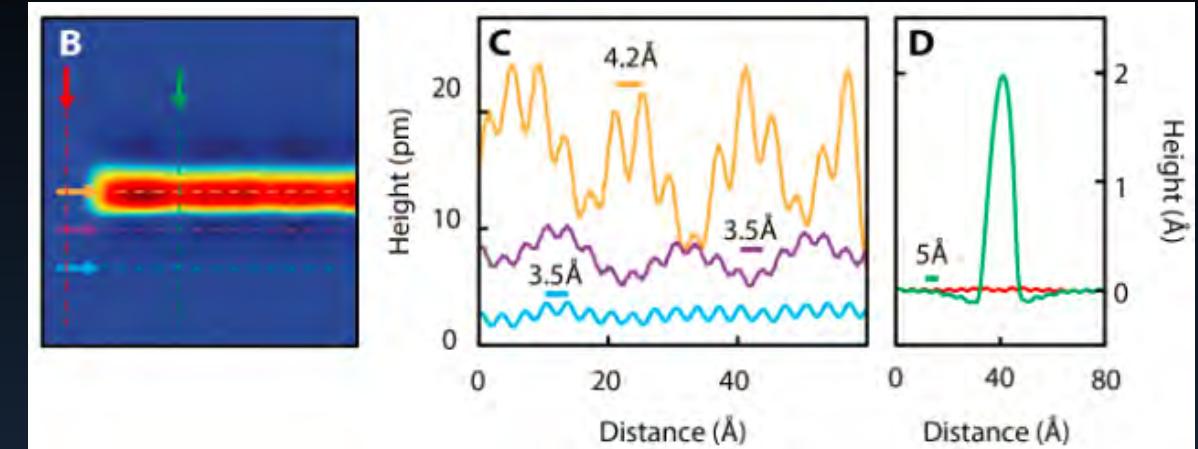

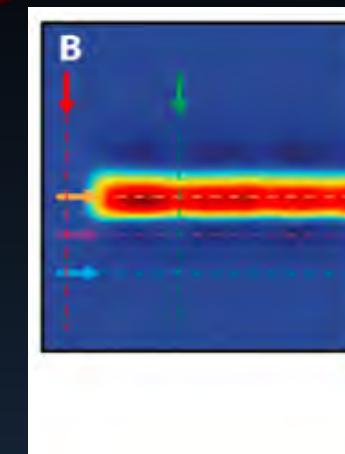

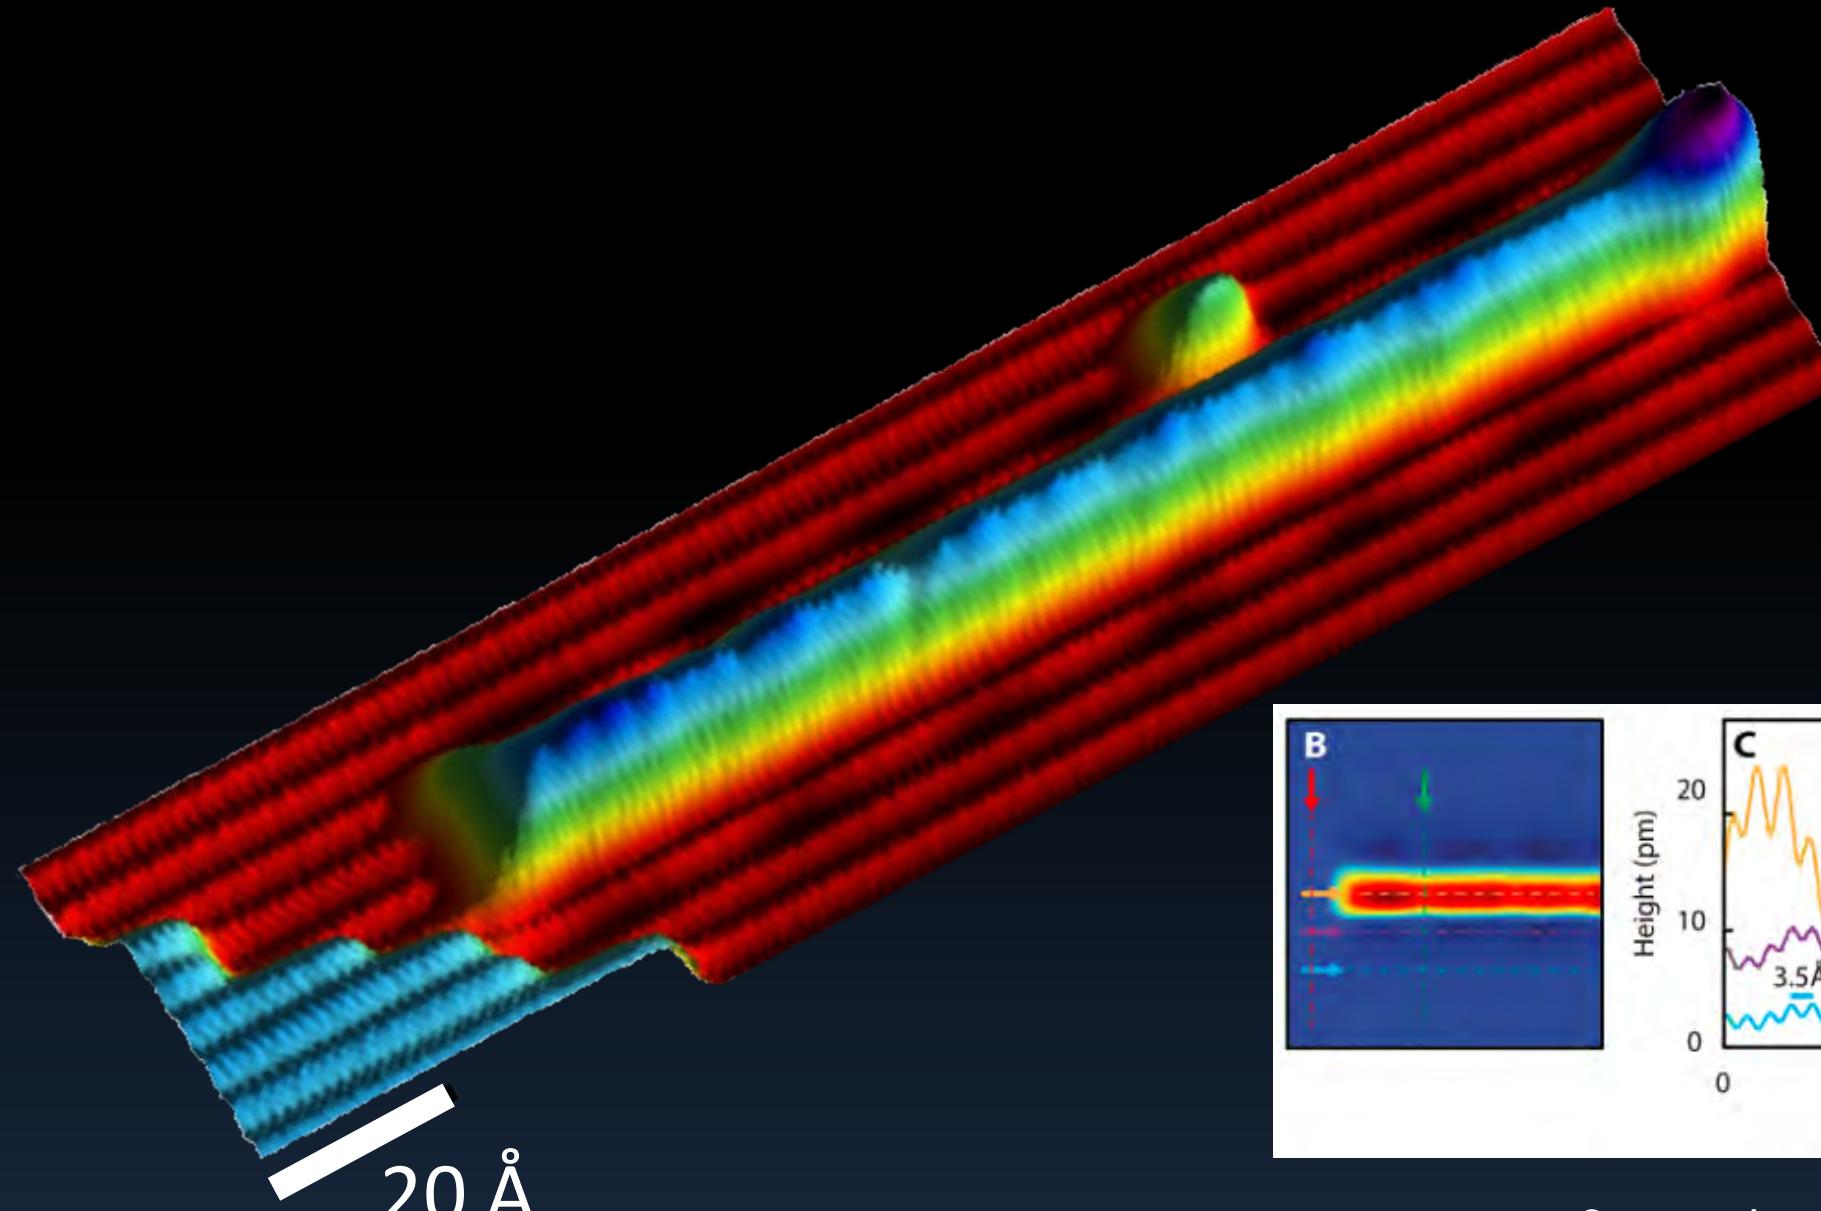

Topographic image

Total chain length up to 800 Å (~ 380 atoms)
“Clean” segments up to 150 Å (~ 70 atoms)

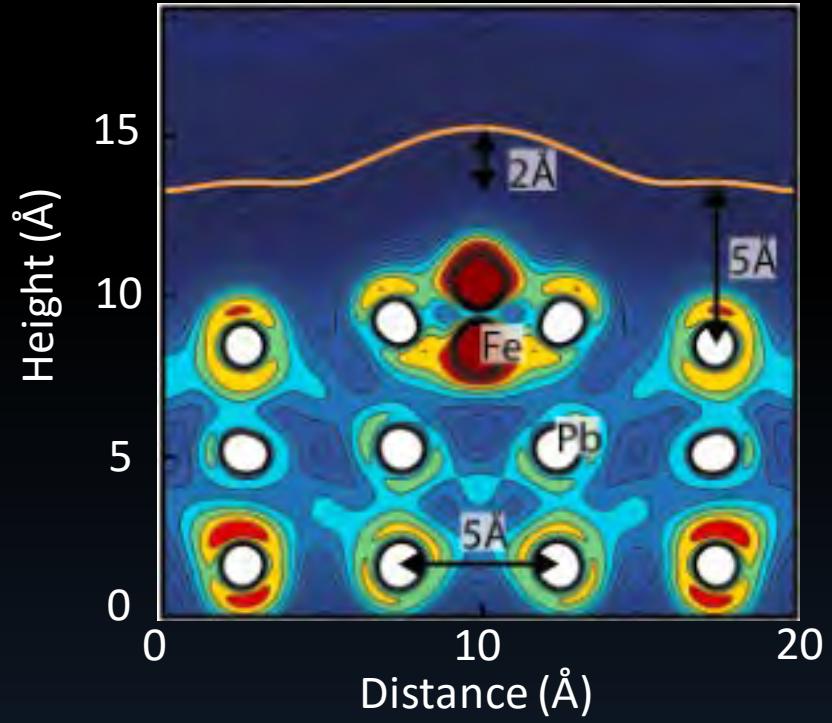

Single atom wide chains on Pb(110) substrate

Corrugation: fitting Fe atoms onto Pb

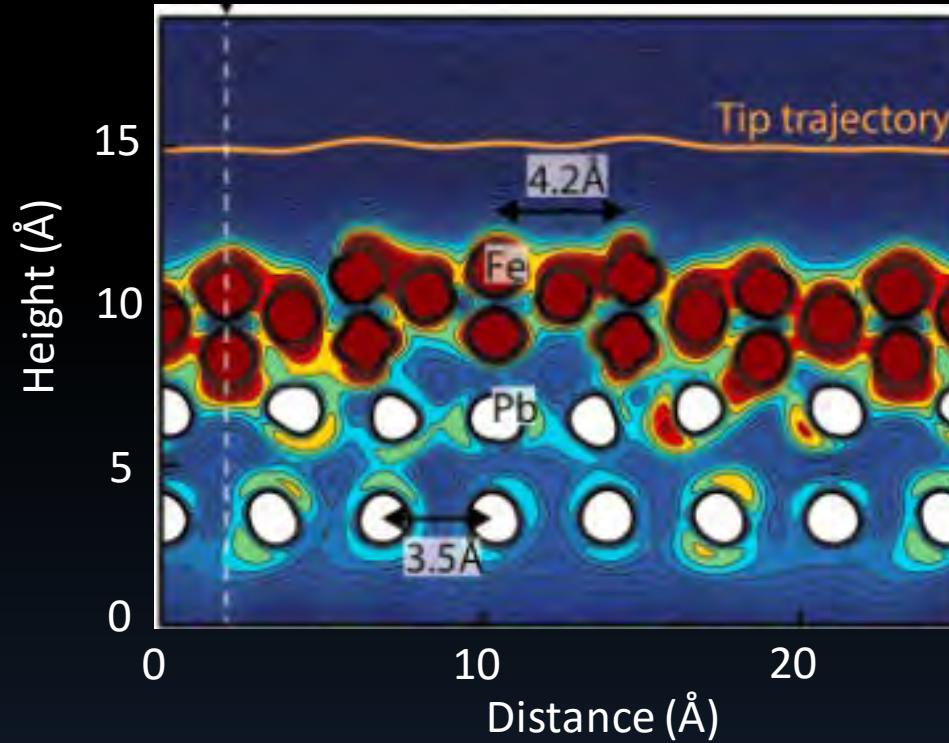

Atomic chains on Pb(110) substrate – DFT

Cut across the chain

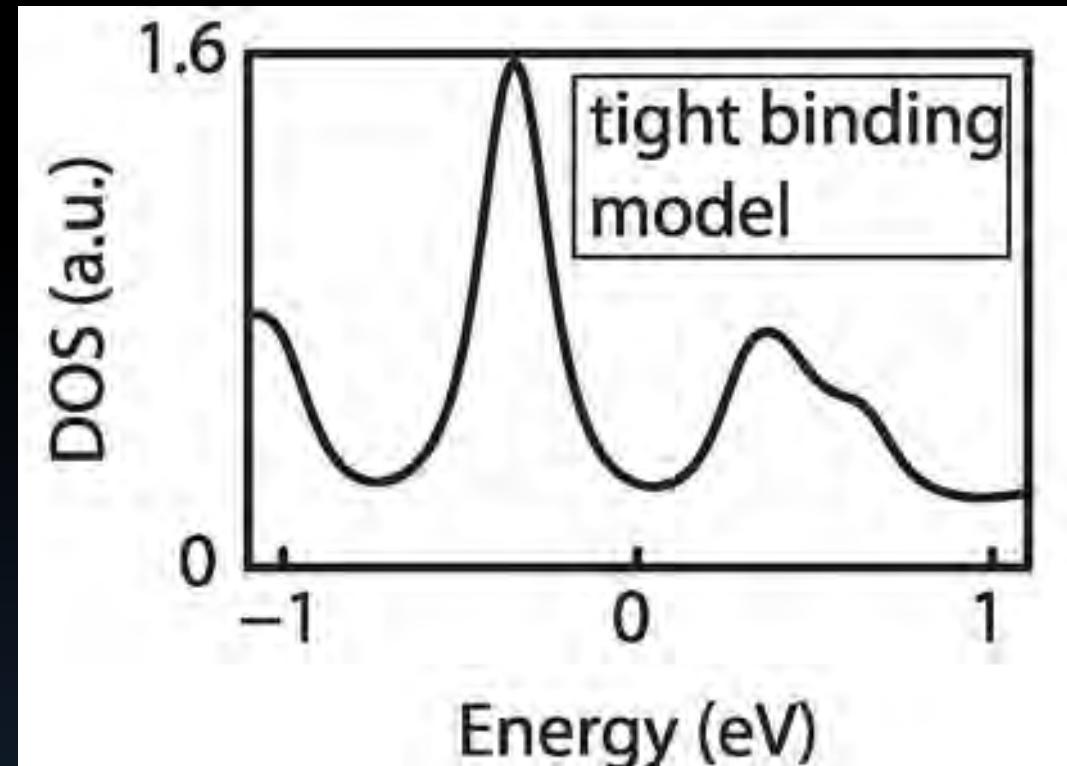

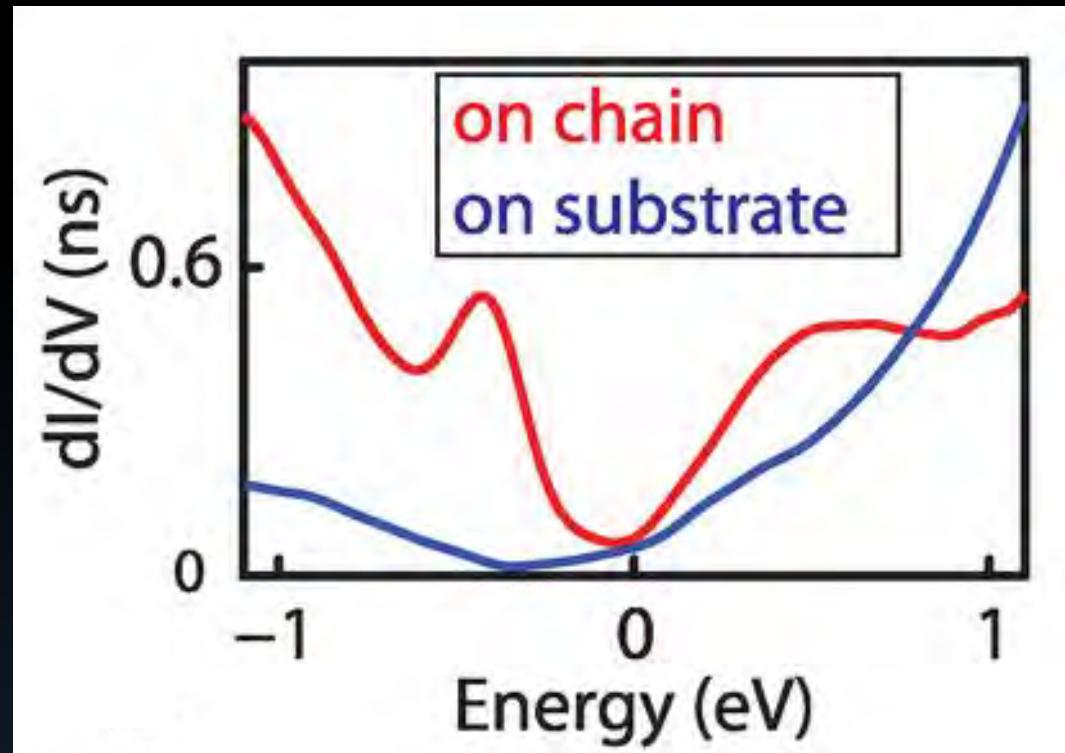

Charge density ($10^{-4}e/a_B^3$)
0 1.5

Cut along the middle of the chain

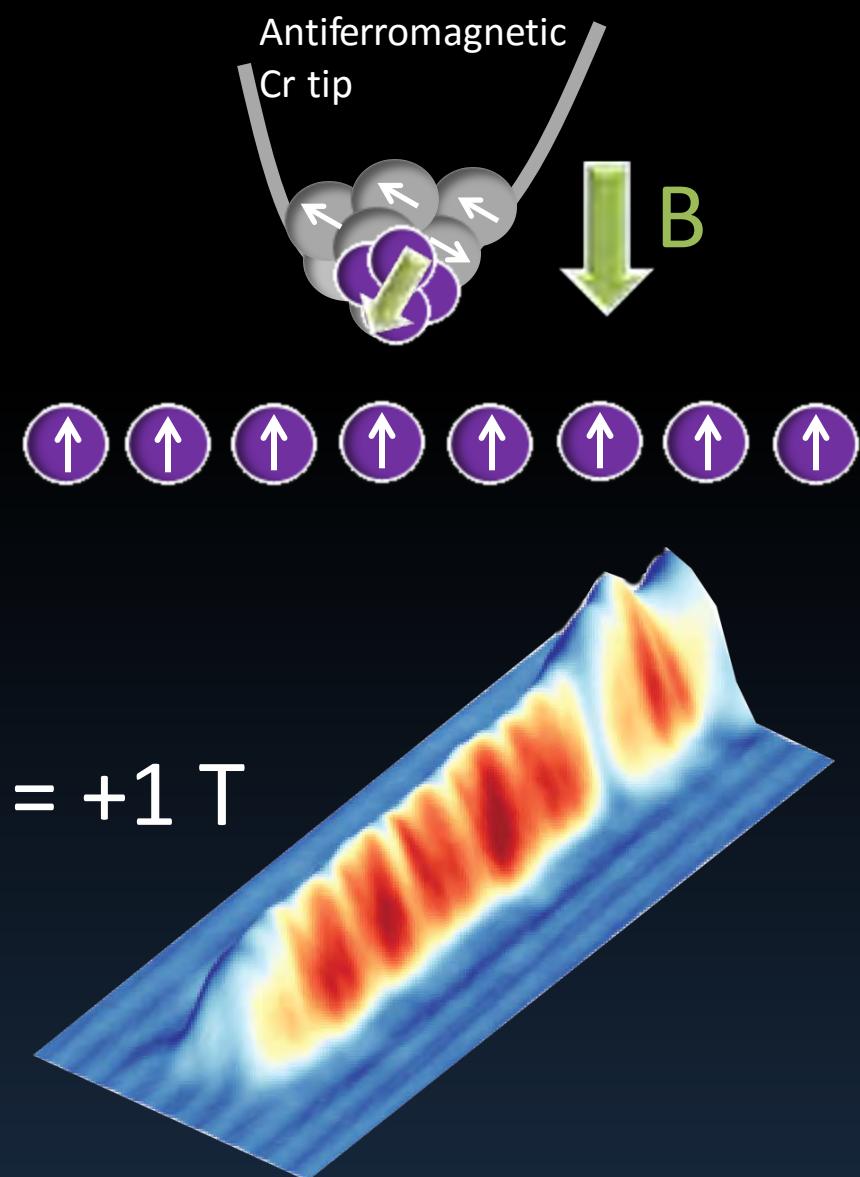

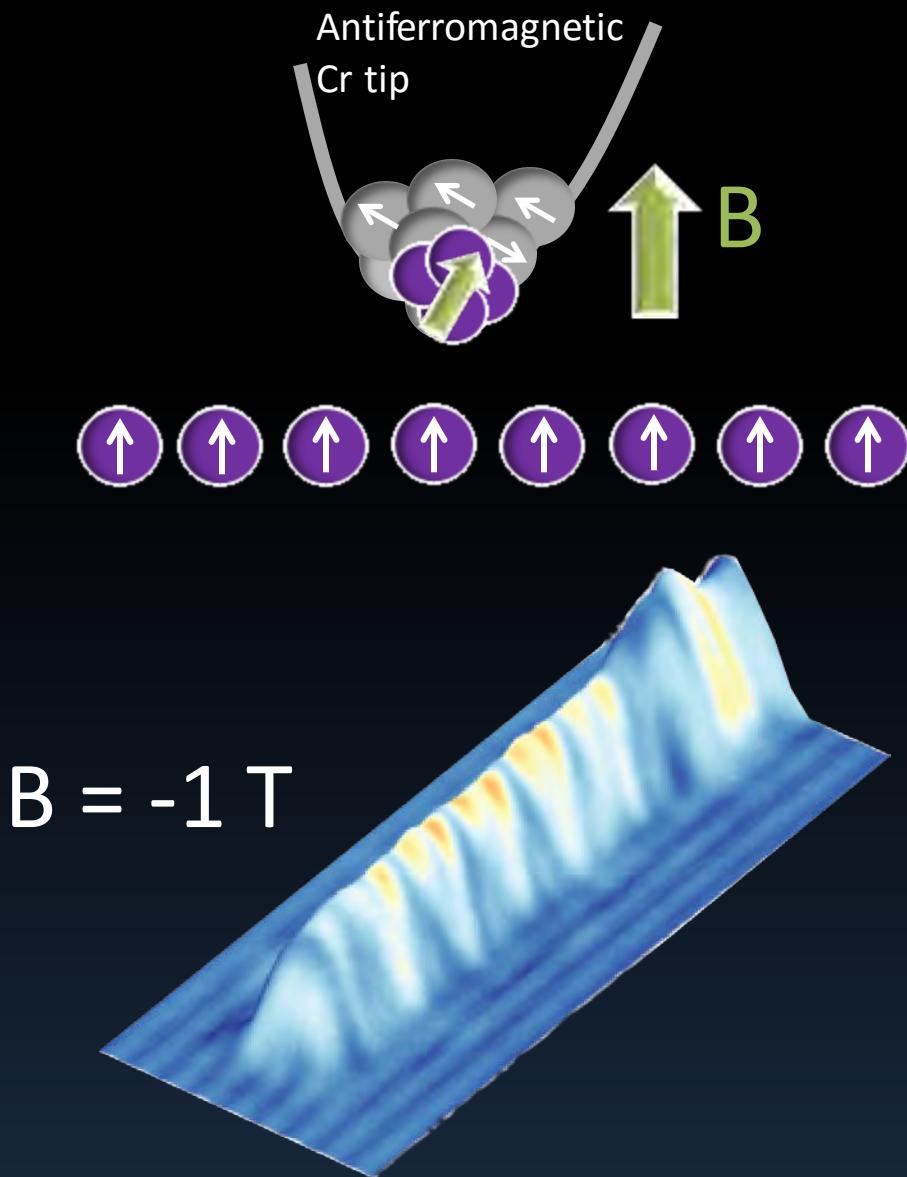

- 1) Chains form zig-zag structure
- 2) Corrugation periodicity reproduced
- 3) Expected height matches experiment

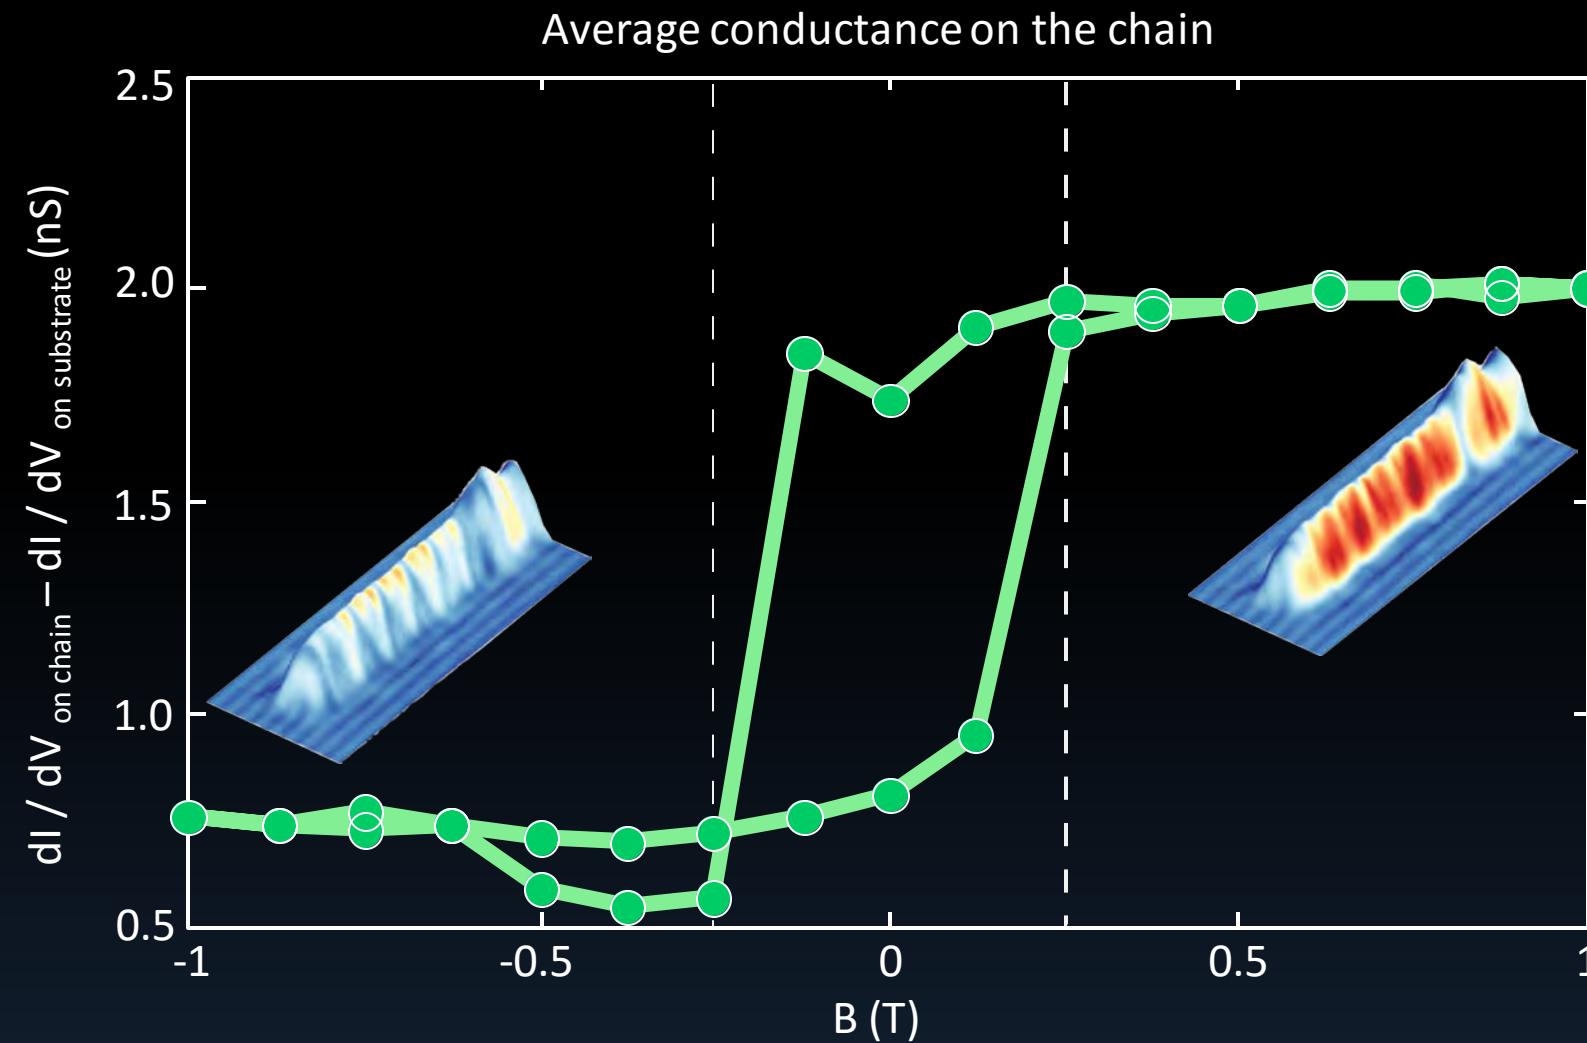

Point spectrum Experiment vs DFT modeling

Spin-polarized measurements

Fe chains on Pb(110): Spin-polarized measurements

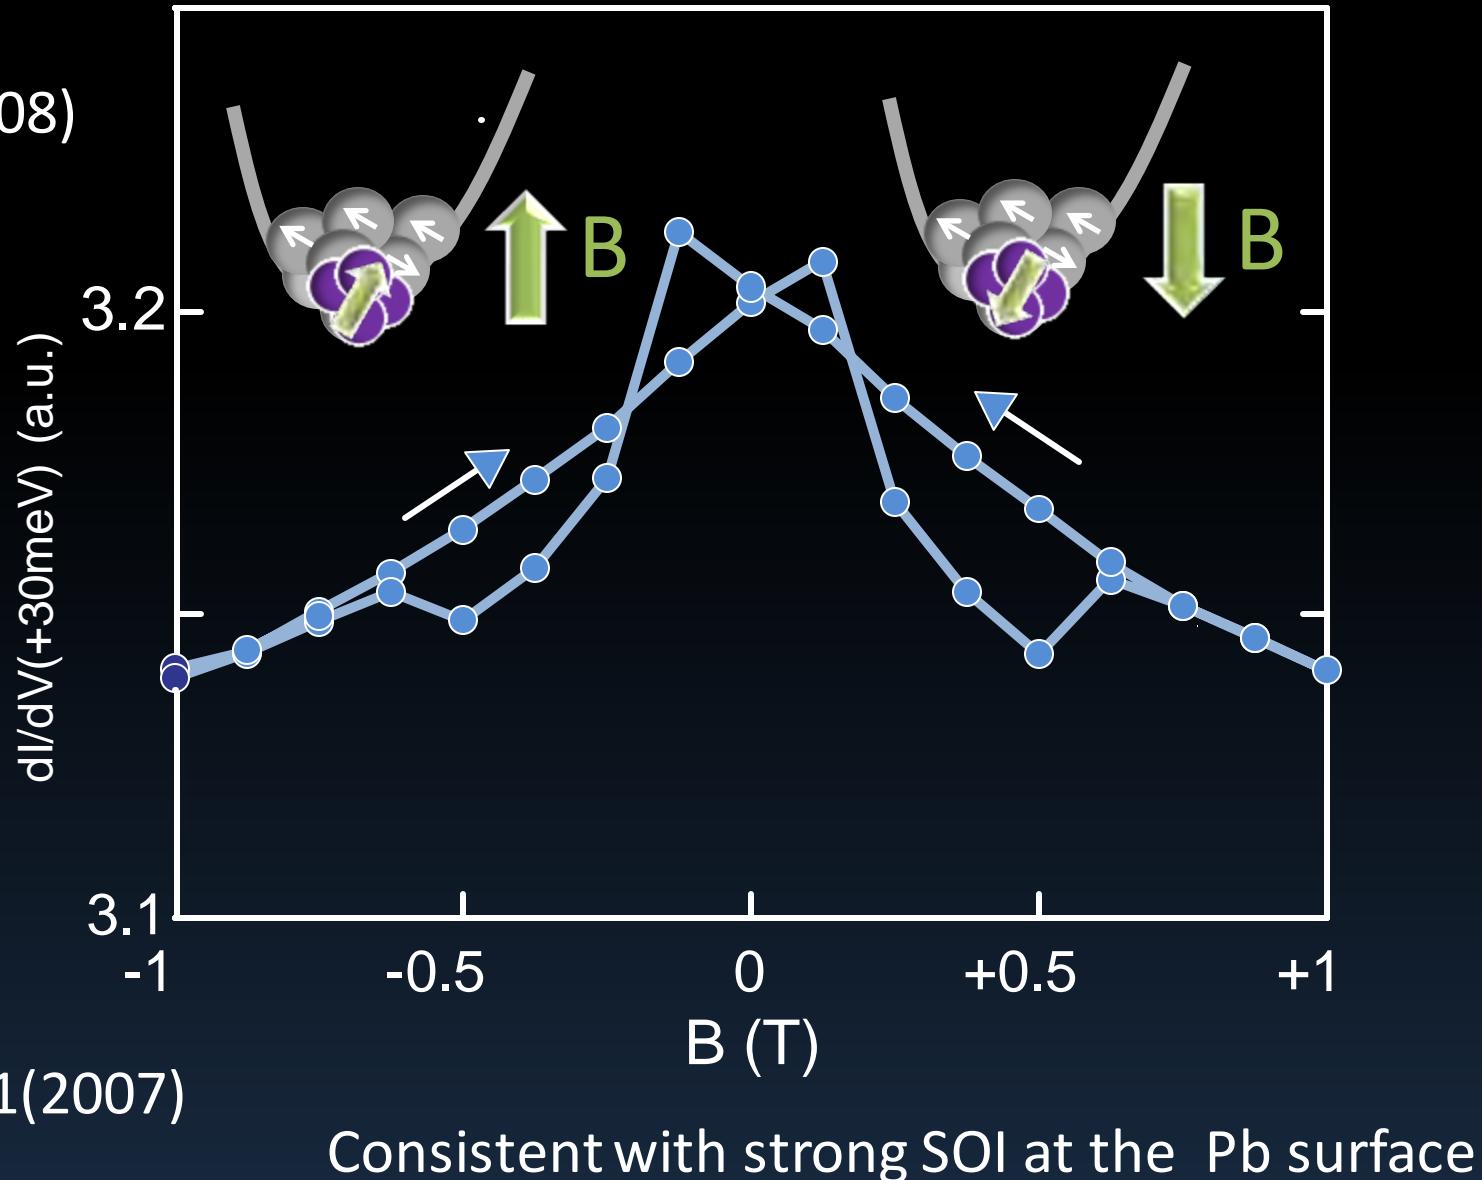

Spin-polarized tip on the Pb(110): Hints of spin-orbit coupling

Pb – Heavy element ($Z=82$, $A=204\text{-}208$)
Strong SOI expected
Symmetry broken at the surface

Experimental signature:
Tunneling suppressed when
Tip polarized out of plane
(Spins in plane)

Similar experiment in 2DEG GaAs:
Moser et al, Phys Rev. Lett. **99**, 056601(2007)

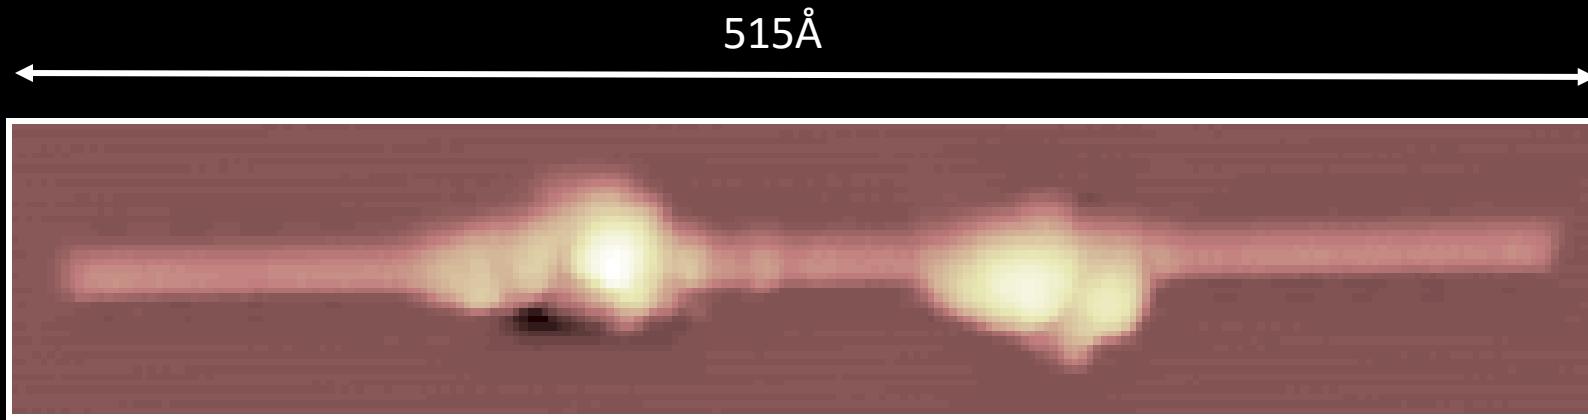

Experimental requirements

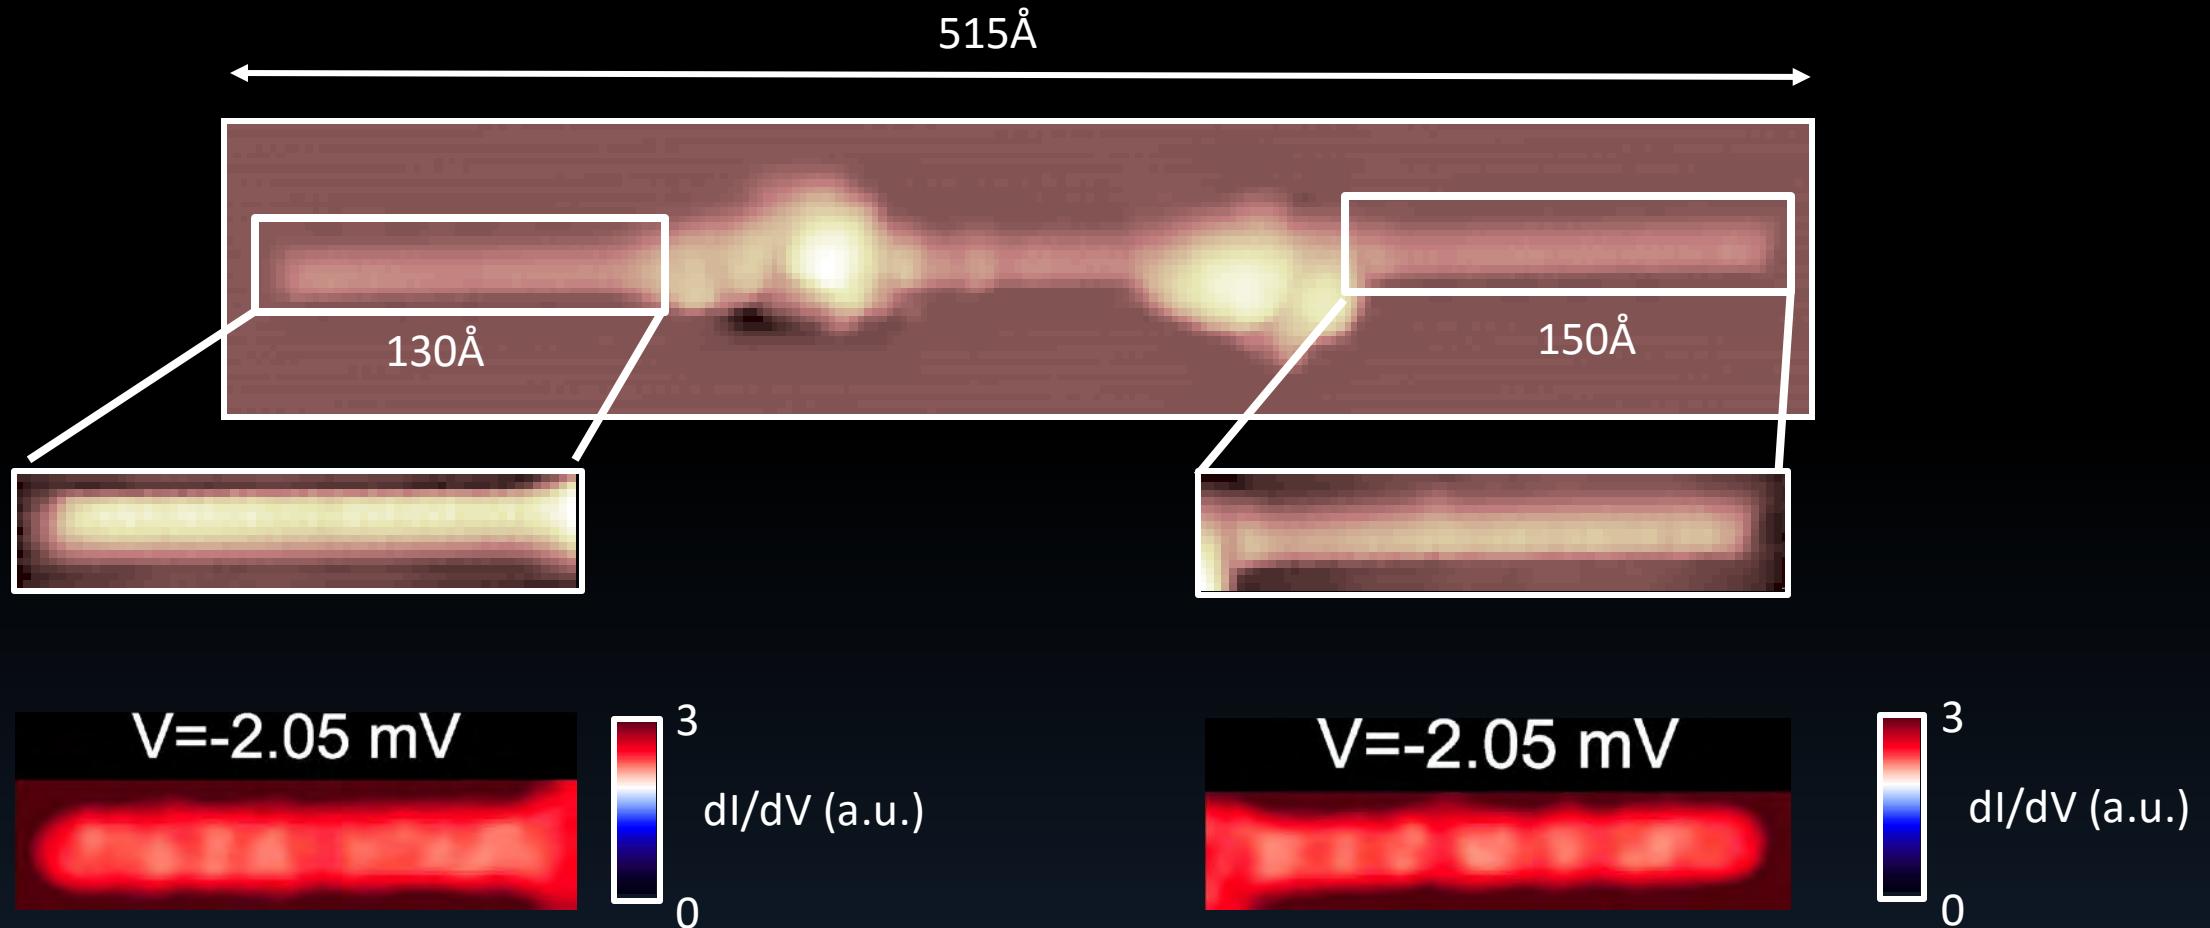

- 1) Atomically flat superconducting substrate 
- 2) Magnetic atoms (break spin degeneracy) 
- 3) Spin-orbit coupling in substrate (to enable p-wave pairing) 

HOW DO STATES INSIDE SUPERCONDCTING GAP LOOK LIKE?????

Summary

Experimental progress:

- ✓ Magnetic chains on superconductor
- ✓ Spin polarized measurement:
 - (Modulated) Ferromagnetism
 - SOI present
- ✓ Observed end states at zero bias:
 - Reproducible on many wires
 - Related to Magnetism and Superconductivity
 - Consistent with FM + SOI scenario for Majorana fermions

THANK YOU!
